Mail Box and Bldg/Room Location: 4670 Rm 4445 Results Format Preferred (circle): PAPER DISK E-MAIL

If more than one search is submitted, please prioritize searches in order of need.

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc. if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: (20S)1alpha-hydroxy-2alpha...19-nor-VitD₃

Inventors (please provide full names): De Luca et al

Earliest Priority Filing Date: 4/22/2002

For Sequence Searches Only Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.

^{19-nor}
Please search for VitD₃ compds and
methods as in cl'

Please note that any claims can be

AB The invention discloses (20S)-1 α -hydroxy-2 α -methyl-19-nor-vitamin D3 and (20S)-1 α -hydroxy-2 β -methyl-19-nor-vitamin D3 and pharmaceutical uses therefor. These compds. exhibit pronounced activity in arresting the proliferation of undifferentiated cells and inducing their differentiation to the monocyte, thus evidencing use as an anticancer agent and for the treatment of skin diseases, e.g. psoriasis, as well as skin conditions such as wrinkles, slack skin, dry skin and insufficient sebum secretion. These compds. also have very significant calcemic activity and therefore may be used to treat immune disorders in humans as well as metabolic bone diseases, e.g. osteoporosis. Compound preparation is described.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB This invention discloses (20S)-1 α -hydroxy-2 α -methyl-19-nor-vitamin D₃ and (20S)-1 α -hydroxy-2 β -methyl-19-nor-vitamin D₃ and pharmaceutical uses therefor. These compounds exhibit pronounced activity in arresting the proliferation of undifferentiated cells and inducing their differentiation to the monocyte thus evidencing use as an anti-cancer agent and for the treatment of skin diseases such as psoriasis as well as skin conditions such as wrinkles, slack skin,

dry skin and insufficient sebum secretion. These compounds also have very significant calcemic activity and therefore may be used to treat immune disorders in humans as well as metabolic bone diseases such as osteoporosis.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

CC 2-10 (Mammalian Hormones)
AB Since the discovery of the active metabolite of vitamin D, i.e., 1 α ,25-dihydroxyvitamin D₃, there has been a continuous effort to synthesize analogs able to carry out many of the functions of the native hormone without raising serum calcium concentration. The present report provides a series of previously undescribed analogs wherein this goal is realized. The authors have prepared 2-methylene-19-nor-1 α -hydroxyvitamin D analogs of 1,25-(OH)D₃ that possess only two to four carbons of the side chain without a hydroxyl thereon. Compared to 1,25-(OH)D₃, these analogs are slightly less active in binding to the vitamin D receptor, in causing HL-60 differentiation, and are slightly less active in in vitro transcription assays using the 24-hydroxylase promoter attached to a luciferase reporter gene. Of considerable importance is that these analogs, given to rats at daily doses of up to 70 μ g/kg of body weight per day, are either unable or only slightly able to raise serum calcium concentration but are nevertheless able to suppress parathyroid hormone levels in plasma up to 100% and induce 24-hydroxylase mRNA in skin. Because of their

ability to act in vivo without raising serum calcium levels, they may be of considerable interest for the systemic treatment of diseases such as psoriasis, cancer, and secondary hyperparathyroidism of renal failure, where a rise in serum calcium is undesirable.

AB The authors have determined the crystal structures of the ligand binding domain (LBD) of the rat vitamin D receptor in ternary complexes with a synthetic LXXLL-containing peptide and the following four ligands: 1 α ,25-dihydroxyvitamin D3; 2-methylene-19-nor-(20S)-1 α ,25-dihydroxyvitamin D3 (2MD); 1 α -hydroxy-2-methylene-19-nor-(20S)-bishomopregnacalciferol (2Mbisp), and 2 α -methyl-19-nor-1 α ,25-dihydroxyvitamin D3 (2AM20R). The conformation of the LBD is identical in each complex. Binding of the 2-carbon-modified analogs does not change the positions of the amino acids in the ligand binding site and has no effect on the interactions in the coactivator binding pocket. The CD ring of the superpotent analog, 2MD, is tilted within the binding site relative to the other ligands in this study and to (20S)-1 α ,25-dihydroxyvitamin D3. The aliphatic side chain of 2MD follows a different path within the binding site; nevertheless, the 25-hydroxyl group at the end of the chain occupies the same position as that of the natural ligand, and the hydrogen bonds with histidines 301 and 393 are maintained. 2Mbisp binds to the receptor despite the absence of the 25-hydroxyl group. A water mol. is observed between His 301 and His 393 in this structure, and it preserves the orientation of the histidines in the binding site. Although the α -chair conformer is highly favored in solution for the A ring of 2AM20R, the crystal structures demonstrate that this ring assumes the β -chair conformation in all cases, and the 1 α -hydroxyl group is equatorial. The peptide folds as a helix and is anchored through hydrogen bonds to a surface groove formed by helices 3, 4, and 12. Electrostatic and hydrophobic interactions between the peptide and the LBD stabilize the active receptor conformation. This stabilization appears necessary for crystal growth.

AB The invention discloses (20S)-1 α -hydroxy-2 α -methyl-19-nor-vitamin D3 and (20S)-1 α -hydroxy-2 β -methyl-19-nor-vitamin D3 and pharmaceutical uses therefor. These compds. exhibit pronounced activity in arresting the proliferation of undifferentiated cells and inducing their differentiation to the monocyte, thus evidencing use as an anticancer agent and for the treatment of skin diseases, e.g. psoriasis, as well as skin conditions such as wrinkles, slack skin, dry skin and insufficient sebum secretion. These compds. also have very significant calcemic activity and therefore may be used to treat immune disorders in humans as well as metabolic bone diseases, e.g. osteoporosis. Compound preparation is described.

AB The present invention discloses a process for preparing 1α -hydroxy-2-methylene-19-nor-homopregnaciferol [I; R = H (II)]. The method includes the steps of ozonating vitamin D2 to bicyclic ketone III, condensing III with an allylic phosphine oxide IV (R = TBDMS) to produce a protecting group to form 22-alc., converting the alc. to an ester, reducing the ester to 17α -isopropyl-19-nor-vitamin D analog I [R = TBDMS (V)], and finally deprotecting V to form II.

GI

AB This invention discloses (20S)-1 α -hydroxy-2-methylene-19-norbishomopregnacalciferol (I), pharmaceutical uses therefor, and a method of purifying this compound to obtain it in crystalline form. I exhibits pronounced activity in arresting the proliferation of undifferentiated cells and inducing their differentiation to the monocyte thus evidencing use as an anti-cancer agent and for the treatment of skin diseases such as psoriasis as well as skin conditions such as wrinkles, slack skin, dry skin and insufficient sebum secretion. I also has little, if any, calcemic activity and therefore may be used to treat immune disorders in humans as well as renal osteodystrophy.

 AB We present a new method to investigate the details of interaction between
 vitamin D nuclear receptor (VDR) and various ligands, namely a
 two-dimensional alanine scanning mutational anal. In this method, the
 transactivation of various ligands is studied in conjunction with a series
 of alanine scanning mutations of the residues lining the ligand binding
 pocket (LBP) of VDR, and the complete set of results is profiled in a
 patch table. We investigated examples from four structurally diverse
 groups of known VDR ligands: the native vitamin D hormone and two compds.
 with the same side chain configuration; four 20-epi compds.; three 19-nor
 compds.; and two nonsecosteroids. The patch table of the results
 indicates characteristics of each group in terms of its interaction with
 18 LBP residues. We demonstrate the validity of this approach by
 application to docking studies of the two nonsecosteroids.

AB The invention discloses 1 α -hydroxy-2-methylene-19-nor-homopregnacalciferol and its pharmaceutical uses. This compound exhibits pronounced activity in arresting the proliferation of undifferentiated cells and inducing their differentiation to the monocyte thus evidencing use as an anti-cancer agent and for the treatment of skin diseases such as psoriasis as well as skin conditions such as wrinkles, slack skin, dry skin and insufficient sebum secretion. This compound also has little, if any, calcemic activity and therefore may be used to treat immune disorders in humans as well as renal osteodystrophy.

AB This invention discloses (20S)-1 α -hydroxy-2 α -methyl-19-nor-vitamin D₃ and (20S)-1 α -hydroxy-2 β -methyl-19-nor-vitamin D₃ and pharmaceutical uses therefor. These compounds exhibit pronounced activity in arresting the proliferation of undifferentiated cells and inducing their differentiation to the monocyte thus evidencing use as an anti-cancer agent and for the treatment of skin diseases such as psoriasis as well as skin conditions such as wrinkles, slack skin, dry skin and insufficient sebum secretion. These compounds also have very significant calcemic activity and therefore may be used to treat immune disorders in humans as well as metabolic bone diseases such as osteoporosis.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB This invention discloses (20S)-1 α -hydroxy-2-methylene-19-nor-
bishomopregnacalciferol and pharmaceutical uses therefor. This compound
exhibits pronounced activity in arresting the proliferation of

undifferentiated cells and inducing their differentiation to the monocyte thus evidencing use as an anti-cancer agent and for the treatment of skin diseases such as psoriasis as well as skin conditions such as wrinkles, slack skin, dry skin and insufficient sebum secretion. This compound also has little, if any, calcemic activity and therefore may be used to treat immune disorders in humans as well as renal osteodystrophy.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.
